

TOYOTA I_Site

More than fleet management

Mobile app for total fleet control

The **mobile app** is a new feature of Toyota I_Site for fleet managers, increasing safety and keeping you in control – wherever you are ...

➤➤➤ sending vital information such as truck impacts and failed pre-op checks directly to your smartphone.

➤➤➤ allowing you to take decisions and act quickly, including reactivating trucks remotely if an incident occurs and monitoring driver activity information.

How does the mobile app work?

1

The mobile app is downloadable and provides the most vital information from the trucks on your site.

2

Details of safety-related incidents are instantly transmitted to your mobile device(s). This can include major impacts, or failed pre-operational checks.*

3

If you receive an alert (sound and vibration) you can immediately investigate. You can reactivate an immobilised truck remotely, including adding comments related to high impacts.

4

The Toyota I_Site mobile app also provides summary information about the latest truck activities as well as driver information such as which trucks they have permission to drive.

The benefits of using Toyota I_Site mobile app:

- Instant communication can **increase safety and efficiency** levels.
- Allows a site manager to get on with other activities while **maintaining control of forklift operations** – wherever he or she is.
- **Reduces time lost** in the event of an incident, as the truck can be remotely reactivated.
- Allows effective but completely **flexible truck management** on a site.
- Provides a cost-effective method of forklift **activity management in multi-shift operations**.

* Requires pre-operational check unit

Even the best technology cannot guarantee accident-free operation. Proper training, the establishment of appropriate work rules, and enforcement of safety regulations will have the greatest impact on workplace safety. – 0214
